

HOME CARE TIPS

How to keep cool and save money!

Home Energy Savings: Caulking

Caulk, install weather stripping or use spray-in foams around windows and doors, on exterior walls, or between cooled and unconditioned spaces (garages, basements, crawl spaces, attics) to keep conditioned air in.

Don't forget to look outside for opportunities to cool inside. Cut back landscaping that is too close to the outdoor unit because it may block airflow that is necessary for the air conditioner's efficiency.

Shading from overhangs, awnings, exterior shades, shade screens, and bushes and trees can reduce unwanted heat gain to the house, especially on east and west windows.
